## The Need for Speed

## Procedure (In Class Laboratory):

- Put the Vernier track on a slight incline as shown above.
- Turn on the LabQuest and make sure the Motion Detector is plugged into the LabQuest at the top at DIG1 (not at the side!).
- Hold the cart up to the highest point on the track at rest.
- Click on the red screen that says DIG1: Position. Click Zero.
- Click on Green Play Button (Collect Button) and let the cart go all the way to the bottom of the ramp.
- Click on Graph tab at the top, Click on Show Graph, Click on Graph 1. You should only see the position-time graph.
- Take the pen and click on 8-10 points on the graph. Record the time and position of each point on the graph.

| Time <br> (seconds) | Position <br> (meters) |
| :---: | :---: |
|  |  |
|  |  |
|  |  |
|  |  |
|  |  |
|  |  |
|  |  |
|  |  |

- Sketch the graph of the position-time function below.

## Data Analysis:

1) Is the graph of position-time linear, is it inversely proportional, or is it squared?
2) If we want to linearize a graph like the position-time function, we need to square the $x$-data. Perform that data change and put your new data in the table below.

| Time $^{\mathbf{2}} \mathbf{( s}^{\mathbf{2}} \mathbf{}$ | Position <br> (meters) |
| :---: | :---: |
|  |  |
|  |  |
|  |  |
|  |  |
|  |  |
|  |  |
|  |  |
|  |  |

3) Graph your new data in the graph below. Label your data and put it in a proper scale and draw a best fit line through your data points.

4) What is the slope of your best-fit line?
5) If the equation is $d=\frac{1}{2} a t^{2}$ and we graphed distance vs. time ${ }^{2}$, the slope will be equal to $1 / 2 \mathrm{a}$. Calculate the acceleration of the cart.
6) Why is this acceleration of the cart not equal to the acceleration of gravity $\left(a=9.8 \mathrm{~m} / \mathrm{s}^{2}\right)$ ?
7) How would you change this experiment to get the acceleration of gravity?

## Procedure (At Home Laboratory):

- Google "Moving Man Simulation"
- Click on "The Moving Man - Position | Velocity | Acceleration - PhET"
- Click on the Picture with the Play Button
- Put in $0.5 \mathrm{~m} / \mathrm{s}^{2}$ for the acceleration.
- Press the Play Button and then Pause approximately every 0.5 seconds.
- Each time you pause, collect the time and position of the moving man in the table below.

| Time <br> (seconds) | Position <br> (meters) |
| :---: | :---: |
|  |  |
|  |  |
|  |  |
|  |  |
|  |  |
|  |  |
|  |  |
|  |  |

- Sketch the graph of the position-time function below.

## Data Analysis:

8) Is the graph of position-time linear, is it inversely proportional, or is it squared?
9) If we want to linearize a graph like the position-time function, we need to square the $x$-data. Perform that data change and put your new data in the table below.

| Time $^{\mathbf{2}} \mathbf{( s}^{\mathbf{2}} \mathbf{}$ | Position <br> (meters) |
| :---: | :---: |
|  |  |
|  |  |
|  |  |
|  |  |
|  |  |
|  |  |
|  |  |
|  |  |

10) Graph your new data in the graph below. Label your data and put it in a proper scale and draw a best fit line through your data points.

11) What is the slope of your best-fit line?
12) If the equation is $d=\frac{1}{2} a t^{2}$ and we graphed distance vs. time ${ }^{2}$, the slope will be equal to $1 / 2$ a. Calculate the acceleration of the cart.
13) Why is this acceleration of the cart not equal to the acceleration of gravity $\left(a=9.8 \mathrm{~m} / \mathrm{s}^{2}\right)$ ?
14) How would you change this experiment to get the acceleration of gravity?
